Comparative Reflection

1. Which system (RBR or CBR) was easier to implement? Why?
- Rule based reasoning is easier to implement because it operates on directional conditional statements like If-Else statements. It directly matches deterministic conditions without needing feature similarity metrics, distance calculations, , or memory management.

2. Which is more flexible in solving unstructured problems?
- Case base reasoning is more flexible for unstructured problems because it evaluates strictural similarities between past experiences and and new situations to propose possible solutions.

3. Which is better for situations with continuously changing data?
- Case base reasoning handles continuously changing data better. It continuously learns through it's cycle.

4. Examples of real-world applications for both.
- Rule based reasoning: Credit card fraud detection triggers based on rules, medical triage checklists, tax compliance software, and automated home smart thermostats.
- Case base reasoning: IT help desk ticketing
